

Chapter I Varieties  
Section 1. Affine Varieties

1.1. (a) Note that  $A(Y) = k[x,y]/(y-x^2)$  i

p

Define  $\phi : k[x] \rightarrow A(Y) = k[x,y]/(y-x^2)$  by the composition  $k[x] \rightarrow k[x,y] \rightarrow k[x,y]/(y-x^2)$

Claim:  $\phi$  is injective; Let  $\phi(f)=\phi(g)$  for  $f,g$  in  $k[x]$ . Then,  $f(x)-g(x)$  in  $(y-x^2) \iff f(x) - g(x) = h(x,y) (y-x^2)$  for some  $h$  in  $k[x,y]$ . But, if  $h$  is not zero,  $\deg_y h(x,y) (y-x^2) \geq 1$ , and  $\deg_y \text{LHS} = 0$ . Hence  $h = 0$ , i.e.  $f(x)=g(x)$ .

Claim:  $\phi$  is surjective; Let  $h(x,y) + (y-x^2)$  be in  $A(Y)$ . Then, if  $h(x,y) = \sum_{i=0}^n f_i(x) y^i$ ,  $f_i$  are in  $k[x]$ . Note that  $h(x,y) - h(x,x^2) = \sum_{i=0}^n f_i(x) (y^i - x^{2i}) = \sum_{i=0}^n f_i(x) (y-x^2)(y^{i-1} + y^{i-2}x^2 + \dots + y(x^2)^{i-2} + (x^2)^{i-1})$  is in  $(y-x^2)$ . Hence,  $h(x,y) + (y-x^2) = h(x,x^2) + (y-x^2)$ . Let  $g(x)=h(x,x^2)$ , then,  $\phi(g) = h(x,y) + (y-x^2)$ .

(b) Note that  $A(Z) = k[x,y]/(xy-1)$ . Assume that  $\phi: A(Y) \rightarrow A(Z)$  is an isomorphism. Since  $\phi$  is surjective, there are  $f,g$  in  $k[x]$  s.t.  $\phi(f(x)) = x+(xy-1)$ ,  $\phi(g(x)) = y+(xy-1)$ .  $\Rightarrow \phi(f(x)g(x)) = xy + (xy-1) = 1+(xy-1) =$  unity of  $A(Z)$ . Since  $\phi$  is an isomorphism,  $f(x)g(x) =$  unity of  $A(Y)$ , i.e.  $f,g$  are in  $k$ . Then for any  $h(x,y) + (xy-1)$  in  $A(Z)$ ,  $h(f,g)$  is in  $k$ , and  $\phi(h(f,g)) = h(x,y) + (xy-1)$  i.e.  $\phi|_k(k) = k[x,y]/(xy-1)$ , but, it is a contradiction.

(c) Let  $f(x,y)$  in  $k[x,y]$  be an irreducible conic polynomial. Let's write  $f(x,y) = ax^2 + 2bxy + cy^2 + dx + ey + g$ ,  $a,b,c,d,e,g$  in  $k$ , and not all of  $a,b,c$  are zero. For this  $f$ , define  $D(f) = b^2-ac$ . We prove the following claims:

1) Whether  $D(f) = 0$  or  $D(f) \neq 0$  is stable under the following operations on  $f$ :

- i) multiply by a nonzero constant  $u$  in  $k$ .
- ii) translation  $x \rightarrow x+l$ ,  $y \rightarrow y+m$ ,  $l,m$  in  $k$ .
- iii) linear transform  $(x,y)^t \rightarrow A(x,y)^t$  for any  $A$  in  $GL(2,k)$ .

2) Any irreducible conic  $f(x,y)$  can be transformed into one of the following two cases using only above three operations:

- i)  $y-x^2$  if  $D(f)=0$  (parabolic)
- ii)  $xy-1$  if  $D(f) \neq 0$  (elliptic)

3) For irreducible conic  $f(x,y)$ , its affine coordinate ring  $k[x,y]/(f)$  is stable (up to isomorphism) under the operations in i).

proof of 1); i)  $D(uf) = (bu)^2 - (au)(cu) = D(f)u^2$ .

ii) Let  $f'$  be the transformed conic. Note that, when calculating  $D(f')$ , only coefficients of  $x^2$ ,  $xy$ ,  $y^2$  matter. But, translation does not change these coefficients. Hence,  $D(f') = D(f)$ .

iii) linear transforms preserve degrees, so, we may assume that  $f$  is homogeneous of degree 2. Note that  $f = ax^2 + 2bxy + cy^2 = (x \ y) \begin{bmatrix} a & b \\ b & c \end{bmatrix} \begin{pmatrix} x \\ y \end{pmatrix}$  and  $D(f) = -\det \begin{bmatrix} a & b \\ b & c \end{bmatrix}$ . So by  $(x,y)^t \rightarrow A(x,y)^t$ , we obtain  $(x,y)^t A^t \begin{bmatrix} a & b \\ b & c \end{bmatrix} A(x,y)^t$ , so  $D(f') = -\det A^t D(f) \det A$ . But,  $A$  is in  $GL(2,k)$ , so,  $D(f') =$  nonzero constant multiple of  $D(f)$ .

proof of 2); i)  $D(f) = b^2-ac=0$ . Then,  $f = ax^2 + 2bxy + cy^2 + dx+ey+g = (\sqrt{a}x + \sqrt{c}y)^2 + dx+ey+g$  ( $k$ : algebraically closed  $\Rightarrow \sqrt{a}, \sqrt{c}, \sqrt{-1}$  exist).

Take transform  $x \leftarrow \sqrt{a}/\sqrt{-1} x + \sqrt{c}/\sqrt{-1} y$   
 $y \leftarrow dx + ey + g$

This transform is a composition of operation ii), iii).

Then,  $f \rightarrow y-x^2$ .

ii)  $D(f)=b^2-ac \neq 0$ . Then,  $f(x,y)=ax^2+2bxy+cy^2+dx+ey+g = a\{(x+b/a)y^2 + c/a y^2 - b^2/a^2 y^2\} + dx+ey + g = a(x+b/ay)^2 + (ac-b^2)/a y^2 + dx+ey+g = (\sqrt{a}x + b/\sqrt{a})y^2 + (\sqrt{(ac-b^2)}/a)y^2 + dx+ey+g = (\sqrt{a}x + (b/\sqrt{a}) + \sqrt{(ac-b^2)}/a)\sqrt{-1}y)(\sqrt{a}x + (b/\sqrt{a}) - \sqrt{(ac-b^2)}/a)\sqrt{-1}y + dx+ey+g$ .  
 Take transform  $x \leftarrow \sqrt{a}x + (b/\sqrt{a}) + \sqrt{(ac-b^2)}/a\sqrt{-1}y$   
 $y \leftarrow \sqrt{a}x + (b/\sqrt{a}) - \sqrt{(ac-b^2)}/a\sqrt{-1}y$   
 which is operation iii).  
 $\Rightarrow f \rightarrow xy + d'x + e'y + g$  for some  $d', e'$  in  $k$ .  
 $= (x+e')(y+d') + g-e'd'$   
 Take transform  $x \leftarrow x+e'$   
 $y \leftarrow y+d'$   
 which is operation ii).  
 $\Rightarrow f \rightarrow xy + g-e'd'$   
 Since  $f$  is irreducible,  $g-e'd'$  is not zero, so there is  $u$  in  $k$  s.t  $u(g-e'd')=-1$ .  
 Then, operation i):  $f \rightarrow (ux)y - 1$   
 operation iii) :  $x \leftarrow ux, y \leftarrow y$   
 $\Rightarrow f \rightarrow xy-1$ .

proof of 3); i) multiplication by  $u$  in  $k^*$  results in,  
 $k[x,y]/(f') = k[x,y]/(uf) = k[x,y]/(f)$  so stable.  
 ii) translation  $x \rightarrow x+l, y \rightarrow y+m$  results in,  
 $k[x,y]/(f') = k[x,y]/(f(x+l,y+m)) \rightarrow k[x,y]/(f)$   
 $g(x,y) + (f') \rightarrow g(x-l,y-m) + (f)$   
 is an isomorphism  
 iii) linear transform  $(x,y)^t \rightarrow A(x,y)^t$  results in,  
 $k[x,y]/(f') = k[x,y]/(f(A(x,y)^t)^t) \rightarrow k[x,y]/(f)$   
 $g(x,y) + (f') \rightarrow g((A^{-1}(x,y)^t)^t) + (f)$   
 is an isomorphism./

So, any irreducible conic  $f$  can be transformed into

$y-x^2$  if  $D(f)=0$ ,  
 $xy-1$  if  $D(f) \neq 0$ .

Under this transformation, coordinate ring is stable upto isomorphism. Hence for any irreducible conic  $f$  in  $k[x,y]$ ,  $A(W)=k[x,y]/(f)$  is isomorphic to  $k[x]=A(Y)$  or  $k[x,y]/(y-x^2) = A(Z)$ ./

1.2. Clearly,  $A(Y)=k[x,y,z]/(z-x^3, y-x^2)$ . Note that  $A(Y)=k[x,x^2,x^3]=k[x]:ID$ , so  $Y$  is irreducible, and  $Y$  is an affine variety. and  $\dim Y = \dim A(Y) = \dim k[x] = 1$  and  $I(Y) = (z-x^3, y-x^2)$ ./

1.3.  $Y=Z(x^2-yz, xz-x)=Z(x^2-yz, x(z-1))$ . Let  $x^2-yz=0$  be (i),  $x(z-1)=0$  be (ii). From (ii), if  $x=0 \Rightarrow y=0$  or  $z=0$  in (i). If  $x \neq 0 \Rightarrow z=1$  and  $x^2-y=0$ . Hence we have three cases:  $\{x^2-y=0 \text{ and } z=1\}, \{x=0, y=0\}, \{x=0, z=0\}$ . Hence  $Y=Z(x^2-y, z-1) \cup Z(x,y) \cup Z(x,z)$ .  
 Note that  $A(Z(x^2-y, z-1))=k[x,y,z]/(x^2-y, z-1) = k[x, x^2, 1]=k[x]:ID$   
 $A(Z(x,y))=k[z]:ID$   
 $A(Z(x,z))=k[y]:ID$   
 So,  $Z(x^2-y, z-1), Z(x,y), Z(x,z)$  are all irreducible and, above expression of  $Y$  is the irreducible decomposition./

1.4. Consider  $Z(x-y)$  in  $A^2$ . It is closed in  $A^2$ . But, in  $A^1 \times A^1$ , closed sets are finite union or arbitrary intersection of  $V_1 \times V_2$ ,  $V_1, V_2$ : closed sets of  $A^1$ . Since  $V_1, V_2$  are empty or  $A^1$  or finite sets,  $V_1 \times V_2$  must be empty or finite set or  $\{finite\} \times A^1$ ,  $A^1 \times \{finite\}$  or  $A^1 \times A^1$ .  $Z(x-y)$  is not any of above form. So,  $A^2$  is not homeomorphic to  $A^1 \times A^1$ ./

1.5. ( $\Rightarrow$ ) Assume that  $B = k[x_1, \dots, x_n]/I(X)$  for some  $X$ . Clearly,  $B$  is then finitely generated. Assume that  $f+I(X)$  satisfies  $(f+I(X))^m = 0$  for some  $m$  in  $N$ . Then,  $f^m$  is in  $I(X) \Rightarrow f^m(x) = 0$  for all  $x$  in  $X \Rightarrow f$  is in  $I(X) \Rightarrow f(x)+I(X)=0$ . Hence, there is no nilpotent element./

( $\Leftarrow$ ) Let  $a_1, a_2, \dots, a_n$  be generators of  $B$  is a  $k$ -algebra. Then,  $\phi: k[x_1, \dots, x_n] \rightarrow B$  mapping  $x_i$  to  $a_i$  is a surjection. Then,  $k[x_1, \dots, x_n]/\ker(\phi) = B$ . So, we have to prove that  $\ker(\phi)$  is a radical

ideal. Let  $f$  be in  $\sqrt{\ker(\phi)}$ .  $\Rightarrow f^m$  is in  $\ker(\phi)$ .  $\Rightarrow \phi(f^m) = (\phi(f))^m = 0$  but,  $B$  does not have nilpotent elements, so  $\phi(f)=0$ . i.e.  $f$  is in  $\ker(\phi)$ . Hence  $\ker(\phi)$  is a radical ideal, and so,  $\ker(\phi)=I(X)$  for some  $X$ . //

1.6. Let  $U$  be nonempty open in  $X$ ,  $X$ :irreducible.

Claim:  $U$  is dense and irreducible.

If  $U$  is not dense, there is a nonempty open set  $V$  in  $X$  s.t.  $U$  does not meet  $V$ . Then  $U^c \cup V^c = X$ , contradicting the irreducibility of  $X$ . Hence  $U$  is dense.

If  $U$  is not irreducible, there is a nonempty proper closed sets  $W_1, W_2$  in  $U$  s.t.  $W_1 \cup W_2 = U$ . Since  $W_1 = U \cap V_1$ ,  $W_2 = U \cap V_2$  for some closed sets  $V_1, V_2$  of  $X$ . Then,  $(V_1 \cup V_2) \cap U^c = X$  contradicting the irreducibility of  $X$ . Hence  $U$  is irreducible.

Claim: When  $Y$  is irreducible, so is  $Y^\sim$ .

Lemma: If every nonempty open set  $U$  of  $Z$  is dense, then  $Z$  is irreducible.

pf) If not,  $V_1 \cup V_2 = Z$ ,  $V_1, V_2$ ; nonempty proper closed. Then,  $(V_1)^c \cap (V_2)^c = \emptyset$ , contradicting denseness of  $(V_1)^c$ .

Hence ETS: Any nonempty open set  $U$  in  $Y^\sim$  is dense. Let  $V$  be any nonempty open set of  $Y^\sim$ . Then,  $U \cap Y$ ,  $V \cap Y$  are nonempty open sets of  $Y$  (because  $Y$  is dense in  $Y^\sim$ ). Hence intersection of all  $U, V, Y =$  nonempty.  $\Rightarrow$  intersection of  $U, V$  is nonempty. //

1.7. (a) (i)  $\Rightarrow$  (ii) Let  $S$  be a nonempty collection of closed subsets. On elements of  $S$ , give a partial order ' $\leq$ ' as  $F_1 \leq F_2$  if  $F_1$  contains  $F_2$ . Let  $\{F_i\}$  be a chain in  $S$ . Since  $X$  is a noetherian space,  $\{F_i\}$  is actually a finite set, so there is a maximal element. Hence by Zorn's lemma, there is a maximal element in  $S$  with respect to ' $\leq$ ', i.e. a minimal element in  $S$  with respect to the inclusion. /

(ii)  $\Rightarrow$  (i) Let  $F_1 \supset F_2 \supset F_3 \dots$  be a descending chain of closed subsets of  $X$ . Then,  $S = \{F_i \mid i \in \mathbb{N}\}$  has a minimal element by (ii), Let  $F_N$  be the minimal element. Then, of course, this chain is stationary beyond  $N$ th. /

(iii)  $\Rightarrow$  (iv) and (iv)  $\Rightarrow$  (iii) can be done in the same way.

(i)  $\Rightarrow$  (iii) Let  $G_1 \subset G_2 \subset G_3 \dots$  be an ascending chain of open sets. Then,  $G_1^c \supset G_2^c \supset G_3^c \dots$  is a descending chain of closed sets. By the DCC, there is  $N$  s.t.  $G_n^c = G_N^c$  for all  $n \geq N$ , i.e.  $G_n = G_N$ . Hence, ACC for open sets hold. /

(iii)  $\Rightarrow$  (i) In the same way as in (i)  $\Rightarrow$  (iii).

Hence, (i), (ii), (iii), (iv) are all equivalent. //

(b) Assume not, i.e. let  $I$  be a collection of open sets of a noetherian space  $X$  s.t. any finite subcollection of  $I$  cannot cover  $X$ . -----(\*) Choose any nonempty  $U_1$  in  $I$ . By (\*),  $U_1$  is properly in  $X$ . Let  $X_1 = (U_1)^c$ ; nonempty closed. Since  $I$  covers  $X$ , there is nonempty  $U_2$  in  $I$  such that  $U_2$  meets  $X_1$ . By (\*) again,  $U_1 \cup U_2$  is properly in  $X$ , so, let  $X_2 = (U_1 \cup U_2)^c$ ; nonempty closed, and  $X_1$  properly contain  $X_2$ . Assume  $U_1, \dots, U_n$  in  $I$ ,  $X_1, \dots, X_n$  are given s.t.  $X_i = (U_1 \cup \dots \cup U_i)^c$ ; nonempty closed and  $\{X_i, i=1, \dots, n\}$  is strictly decreasing. Since  $I$  covers  $X$ , there is a nonempty  $U_{n+1}$  in  $I$ , so, let  $X_{n+1} = (U_1 \cup \dots \cup U_{n+1})^c$ ; nonempty closed, and, then,  $\{X_i, i=1, \dots, n+1\}$  is strictly decreasing. Hence by induction, we can obtain an infinite properly descending chain of closed subsets of  $X \Rightarrow$  contradiction because  $X$  is noetherian. //

(c) Let  $Y$  be in  $X$ , and  $X$  is a noetherian space. If  $Y$  is not noetherian, there is a sequence of strictly decreasing closed subsets of  $Y$ :  $\{Y_i, i=1, 2, \dots\}$ . Since  $Y$  has induced topology,  $Y_i = Y \cap F_i$  for closed subsets  $F_i$  of  $X$ . Since  $Y_i$  contains  $Y_{i+1}$ ,  $Y_{i+1} = Y \cap F_{i+1}$ . Hence, by replacing  $F_i$  by intersection of  $F_1, \dots, F_i$ , WMA  $\{F_i, i=1, 2, \dots\}$  is an

decreasing sequence of closed sets of  $X$ . Since  $X$  is noetherian,  
 $F_N = F_{N+1} = \dots \Rightarrow Y_N = Y_{N+1} = \dots$  (contradiction)//

(d) If  $V$  is an irreducible closed set,  $V$  is a single point. (If not, two points  $x, y$  have disjoint open sets, which are dense.) Since  $X$  is noetherian, it is a finite union of irreducible closed sets, i.e. finite union of points. Hence  $X$  has only finitely many points.//

1.8. Let  $Y = Z(p)$ ,  $H = Z(f)$  where  $p$  is a prime ideal of  $k[x_1, \dots, x_n]$ ,  $f$ : a nonconstant polynomial. Since  $Y \not\subset H$ ,  $f$  is not in  $p$ , and  $Y \cap H = Z(p, f)$ .  
 Consider  $A(Y) = k[x_1, \dots, x_n]/p$ . Then,  $f+p$  in  $A(Y)$  is not zero, not unit, not a zero-divisor. since  $A(Y)$  is a noetherian space, there is a primary decomposition  $(f+p) = \bigcap_{i=1}^m q_i$  with  $r(q_i) = p_i$ ; minimal prime ideals of  $(f+p)$ .  
 Then, by the Krull's Hauptidealsatz,  $ht(p_i) = 1$ , and every component of  $Y \cap H$  corresponds to  $p_i$ .  
 Here,  $ht(p_i) + \dim A(Y)/p_i = k[x_1, \dots, x_n]/(p, p_i)$  : coordinate ring of each irreducible component  $\Rightarrow \dim(\text{component}) = \dim A(Y)/p_i = \dim A(Y) - ht(p_i) = r-1$ .//

1.9. Let  $a = (f_1, f_2, \dots, f_r)$   
 $\Rightarrow \emptyset \subsetneq Z(f_1) \subsetneq Z(f_1, f_2) \subsetneq \dots \subsetneq Z(f_1, f_2, \dots, f_r) = a$ .  
 $\Rightarrow A^n \supsetneq Z(f_1) \supsetneq Z(f_1, f_2) \supsetneq \dots \supsetneq Z(a)$ .  
 so, note that  $\dim Z(f_1, f_2, \dots, f_i) \geq \dim Z(f_1, f_2, \dots, f_{i+1})$  for each  $i$ .  
 If  $f_{i+1}$  is not a zero-divisor in  $A(Z(f_1, f_2, \dots, f_i))$ , there is a minimal prime ideal  $p$  in  $A(Z(f_1, f_2, \dots, f_i))$  containing the image of  $f_{i+1}$  with  $ht(p) = 1$ . So,  $ht(p) + \dim A(Z(f_1, f_2, \dots, f_i))/p = \dim A(Z(f_1, f_2, \dots, f_i))$ , so,  
 $\dim Z(f_1, f_2, \dots, f_{i+1}) = \dim A(Z(f_1, f_2, \dots, f_{i+1})) \geq \dim A(Z(f_1, f_2, \dots, f_i))/p = \dim Z(f_1, f_2, \dots, f_i) - 1$ .  
 Otherwise,  $Z(f_1, f_2, \dots, f_i) = Z(f_1, f_2, \dots, f_{i+1})$ .  
 Hence, at each step, dimension decreases by 0 or 1. Because there are  $r$  such steps, hence dimension of  $Z(f_1, f_2, \dots, f_r) \geq n - r$ .//

1.10. (a) Any closed subset of  $Y$  is of the form :  $Y \cap F$ ,  $F$ : closed in  $X$ .  
 For any chain  $Y \cap F_0 \subsetneq Y \cap F_1 \subsetneq \dots \subsetneq Y \cap F_n$  of irreducible closed sets,  $cl(Y \cap F_0) \subsetneq cl(Y \cap F_1) \subsetneq \dots \subsetneq cl(Y \cap F_n)$  : irreducible closed sets of  $X$ . Hence  $\dim Y \leq \dim X$ .

(b)  $\dim U_i \leq \dim X$  is clear by (a) for all  $i$ . Hence  $\sup \dim U_i \leq \dim X$ .  
 Conversely, for any chain of irreducible closed subsets  $F_0 \subsetneq F_1 \subsetneq \dots \subsetneq F_n$ , choose an open set  $U_0$  in  $\{U_i\}$  s.t.  $F_0 \cap U_0 \neq \emptyset$ . Then, since  $F_0 \subsetneq F_1$ ,  $F_1 \cap U_0 \neq \emptyset$ . Since  $F_1$  is irreducible and  $F_1 \cap U_0$  is a nonempty open subset, it must be dense in  $F_1$ . Then,  $F_1 - F_0$  : nonempty open subset of  $F_1 \Rightarrow (F_1 - F_0) \cap U_0 \neq \emptyset$ . Hence,  $F_0 \subsetneq F_1 \cap U_0$ . But, using same argument, we can construct a strict chain  $\{F_i \cap U_0\}_{i=0,1,\dots,n}$ . Hence  $\dim U_0 \geq \dim X$ . Hence  $\sup \dim U_i = \dim X$ .//

(c) Consider  $X = \{0, 1\}$  with topology  $T = \{\emptyset, \{0\}, \{0, 1\}\}$ . Then,  $\{0\}$  is dense open subset, because arbitrary open set intersects it. But,  $\dim\{0\} = 0$ , because  $\{0\}$  doesnot contain any nonempty closed subsets other than itself. But,  $\{1\} \subsetneq \{1, 2\}$  is the maximal chain of irreducible closed sets of  $X$ , so  $\dim X = 1$ . Hence  $\dim U < \dim X$ .//

(d) Assume not, i.e.  $Y \subsetneq X$ . Choose a maximal chain of irreducible closed subsets of  $Y$  with the maximal length:  $Y_0 \subsetneq Y_1 \subsetneq \dots \subsetneq Y_n$ . Then, by adding  $X$ , we obtain a chain with length  $n+1$ , so  $\dim X \geq n+1 > n = \dim Y$ . contradiction .//

(e) (From Atiyah-Macdonald)

Let  $A = k[x_1, \dots, x_n, \dots]$ ,  $m_1, m_2, \dots$  : increasing sequence of natural numbers, s.t.  $m_{i+1} - m_i > m_i - m_{i-1}$  for all  $i > 1$ . Let  $p_i = (x_{\{m_i+1\}}, \dots, x_{\{m_{i+1}\}})$ ,  $S = (\text{Union of all } P_i)^c$ . Let  $X = \text{Spec}(S^{-1}A) \Rightarrow X$  is noetherian because  $S^{-1}A$  is a noetherian ring (Chapter 7, Ex.9 of Atiyah-Macdonald) but,,  $S^{-1}p_i$  has height  $m_{i+1} - m_i$  :  $\dim S^{-1}A = \text{infinity}$  //

1.11. Define  $\phi: k[x,y,z] \rightarrow k[t^3, t^4, t^5]$  by  $\phi(f(x,y,z)) = f(t^3, t^4, t^5)$ . Clearly  $\phi$  is surjective and  $f$  is in  $\ker(\phi)$  iff  $f(t^3, t^4, t^5) = 0$ , i.e.  $f$  is in  $I(Y)$ . Hence  $\ker(\phi) = I(Y)$ . Note that  $k[t^3, t^4, t^5]$  is in  $k[t]$ , so it is an ID, hence  $I(Y)$  is a prime ideal. Now,  $\text{ht}(I(Y)) + \dim(k[x,y,z]/I(Y)) = \dim(k[x,y,z])$ . Note  $\dim k[x,y,z]/I(Y) = \dim k[t^3, t^4, t^5] = \dim k[t]$  (because  $k[t]$  is an integral extension of  $k[t^3, t^4, t^5]$ ) = 1. Hence,  $\text{ht}(I(Y)) = 3-1=2$ . Now we show that  $I(Y)$  cannot be generated by 2 elements. Let's search for the elements of  $I(Y)$  with "minimal degree, next minimal degree, etc." Let  $f(x,y,z)$  be in  $I(Y)$ ,  $f(x,y,z) = \sum_{i,j,k} b(i,j,k) x^i y^j z^k$ ,  $b(i,j,k)$  is in  $k$ . Then,  $f(t^3, t^4, t^5) = 0$  implies  $\sum_{i,j,k} b(i,j,k) t^{(3i+4j+5k)} = 0$ . Let's collect terms with same degree with respect to  $t$ . Let  $n = 3i+4j+5k$ . If  $n=0$ ,  $(i,j,k) = (0,0,0) \Rightarrow b(0,0,0) = 0$ .  $n=1$ ,  $(i,j,k)$  does not exist.  $n=2$ ,  $(i,j,k)$  does not exist.  $n=3$ ,  $(i,j,k) = (1,0,0) \Rightarrow b(1,0,0) = 0$ .  $n=4$ ,  $(i,j,k) = (0,1,0) \Rightarrow b(0,1,0) = 0$ .  $n=5$ ,  $(i,j,k) = (0,0,1) \Rightarrow b(0,0,1) = 0$ .  $n=6$ ,  $(i,j,k) = (2,0,0) \Rightarrow b(2,0,0) = 0$ .  $n=7$ ,  $(i,j,k) = (1,1,0) \Rightarrow b(1,1,0) = 0$ .  $n=8$ ,  $(i,j,k) = (1,0,1)$  and  $(0,2,0) \Rightarrow b(1,0,1) + b(0,2,0) = 0$  i.e. we find  $xz - y^2 = f_1$ .  $n=9$ ,  $(i,j,k) = (3,0,0)$  and  $(0,1,1) \Rightarrow b(3,0,0) + b(0,1,1) = 0$  i.e. we find  $x^3 - yz = f_2$ .  $n=10$ ,  $(i,j,k) = (2,1,0)$  and  $(0,0,2) \Rightarrow b(2,1,0) + b(0,0,2) = 0$  i.e. we find  $x^2 y - z^2 = f_3$ .  $n=11$ ,  $(i,j,k) = (1,2,0)$  and  $(2,0,1) \Rightarrow b(1,2,0) + b(2,0,1) = 0$  i.e.  $xy^2 - x^2 z = x(y^2 - xz) = x f_1$ .  $n \geq 12$ , if there are solutions  $(i,j,k)$ ,  $i+j+k \geq 3$ . So, polynomials obtained from now must have degree  $\geq 3$  for every term. So, we have  $(f_1, f_2, f_3) \subset I(Y)$ . Note that  $f_1$  is not in  $(f_2, f_3)$  ( $\deg f_1 = 2$ ,  $\deg$  of minimal degree term of  $f_2, f_3 = 2$ )  $f_2$  is not in  $(f_1, f_3)$  ( $f_2$  has  $yz$  but,  $\deg 2$  terms of  $f_1$  and  $f_3$  are  $xz, y^2, z^2$ )  $f_3$  is not in  $(f_1, f_2)$  ( $f_3$  has  $z^2$  but,  $\deg 2$  terms of  $f_1$  and  $f_2$  are  $xz, y^2, yz$ ) Note that if we find all other generators  $f_4, f_5, \dots$  of  $I(Y)$ , each term of  $f_i$  ( $i \geq 4$ ) must have degree  $\geq 3$  and  $f_1, f_2, f_3$  are the only generators those who have terms of degree 2. If  $(g_1, g_2) = I(Y)$ , i.e.  $I(Y)$  can be generated by only two elements,  $(g_1, g_2)$  must contain  $f_1, f_2, f_3$ . By the minimality of the degrees of  $f_1, f_2, f_3$  in  $I(Y)$ ,  $g_1, g_2$  must be constant multiples of  $f_1, f_2, f_3$ . But, it is not possible. Hence  $I(Y)$  must have at least 3 generators. /

Remark: We did not prove that  $(xz - y^2, x^3 - yz, x^2 y - z^2) = I(Y)$ . It requires more work.

1.12. Let  $f(x,y) = (x^2 - 1)^2 + y^2 = x^4 - 2x^2 + 1 + y^2$ . It is irreducible. ( $f$  has a factorization in  $C[x,y]$ :  $(x^2 - 1 + iy)(x^2 - 1 - iy)$  in to irreducibles. If  $f$  factors in  $R[x,y]$ , since both  $R[x,y]$  and  $C[x,y]$  are UFDs and  $R[x,y]$  is in  $C[x,y]$ , the factorization must be equal to  $(x^2 - 1 + iy)(x^2 - 1 - iy)$ , but it is not possible in  $R[x,y]$ .) But,  $Z(f) = \{(1,0), (-1,0)\} = Z(x-1, y) \cup Z(z+1, y)$ . which is obviously reducible. //
